

Hello, today with my comrade, we are going to present you our slideshow. It's about a futuristic house that we imagine
house that dreaming have
Now we'll explain to you the summary

First we will introduce the key question to put you in the context
then we'll explain the different equipment and systems that will be there and what kind of energy it will run on
After that, we'll give you the ideas we've had about new systems that could be put in place, engine systems and systems based on artificial intelligence
Finally, we will move on to the conclusion.

Firstly, for us the house of the future will have to be a secure house, for that it could be equipped with alarm, movement sensor and camera with why not facial recognition at the entrance of the house.
This would allow the different owners to be serene while being out of the house.

Also, with this there could be a voice assistance system throughout the house with a control center that will take care of the safety of the houses and the owners that could be triggered automatically or manually

Then, in the house of the future, new features could be interesting. We have thought of a mirror that would propose a dress code according to the day that is planned and according to what the person has
according to what the person has in their wardrobe.
For example, if the person has to go to work, the mirror will suggest sober clothes with a tie. If the person goes to a party, the proposed outfit will be a little more festive.

We could imagine this technology in other areas that would be other situations than ours such as makeup, surgery ...

Moreover, the house will have to consume very little energy and even be autonomous. For that, it could be equipped with very efficient solar panels and/or other eco-responsible equipment if
the abolition of nuclear fission is not abolished

Concerning this house of the future, we have thought of something a little more advanced which would be to make the house turn on itself so that it can face or against the sun according to what the owner wants.
sun, depending on what the owner wants, and he can manage this feature from his phone. This new system will work thanks to different motors that will be powered by solar panels of photovoltaic type

We have now seen the different systems that it would be interesting to put in place in the house of the future, including equipment, accessories, motor systems, electrical systems and artificial intelligence.
Our ideas are ambitious but the question is when will these systems appear?

We have finished our presentation
If you have any questions, please ask us
